

The U.S. Has Abundant Uranium Resources

Uranium is a vital element in the fuel for nuclear power plants and a cornerstone of U.S. defense and national security. The U.S. is home to extensive uranium resources that can meet these needs for years to come.

However, the domestic companies that mine this uranium are under attack. Russia's and its allies' state-owned enterprises flood the global market with subsidized uranium – and domestic uranium mining is collapsing.

U.S. uranium miners proposed a quota that, in effect, reserves a **modest 25% of the U.S. market for domestic uranium**. A properly designed quota will create a U.S. market environment for long-term contracts that can support the domestic industry's recovery.

The U.S. has more than 300 years of supply under the proposed 25% quota.

We encourage President Trump to act now to preserve U.S. uranium mining and protect our national security – before it's too late.
